Tools:

LIT:

Speeds up the day lighting simulation process for LEED compliance.

CLACS:

Tool which assists in designing Chiller Plants for buildings.

ECBC Baseline Generator:

The program uses an Energy Model file (idf) and creates code compliant baseline and proposed case energy model for compliance.

LIT

Tool to automate
modelling and
reporting of Daylight
simulation for LEED
compliance

Features

- Expedites the LEED Daylighting compliance process by upto 5 times
- Automates Geometry Generation
- Automates Reporting for LEED: No hassle of postprocessing
- Easy to navigate interface
- Can be used by amateurs without in-depth knowledge on Daylighting algorithms

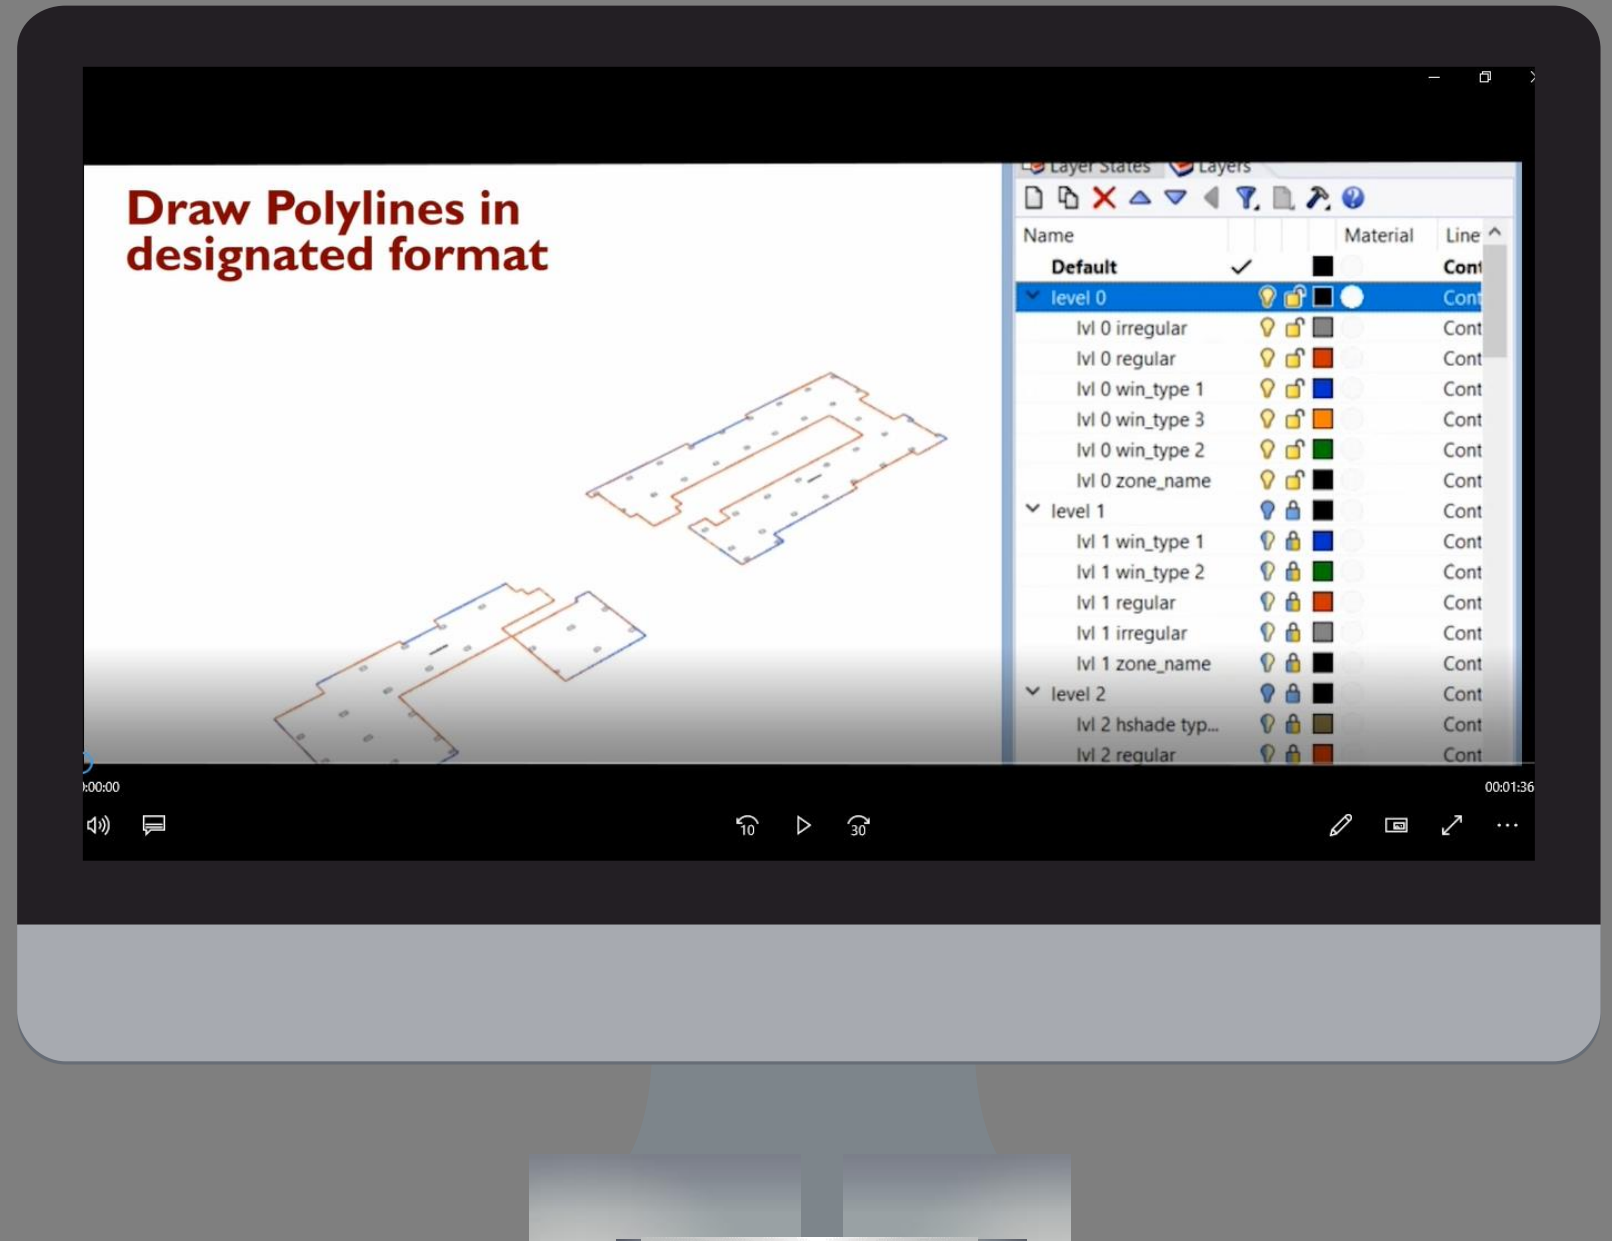

Pain point 1:

Geometry Generation takes a too much Time. It involves the following steps:

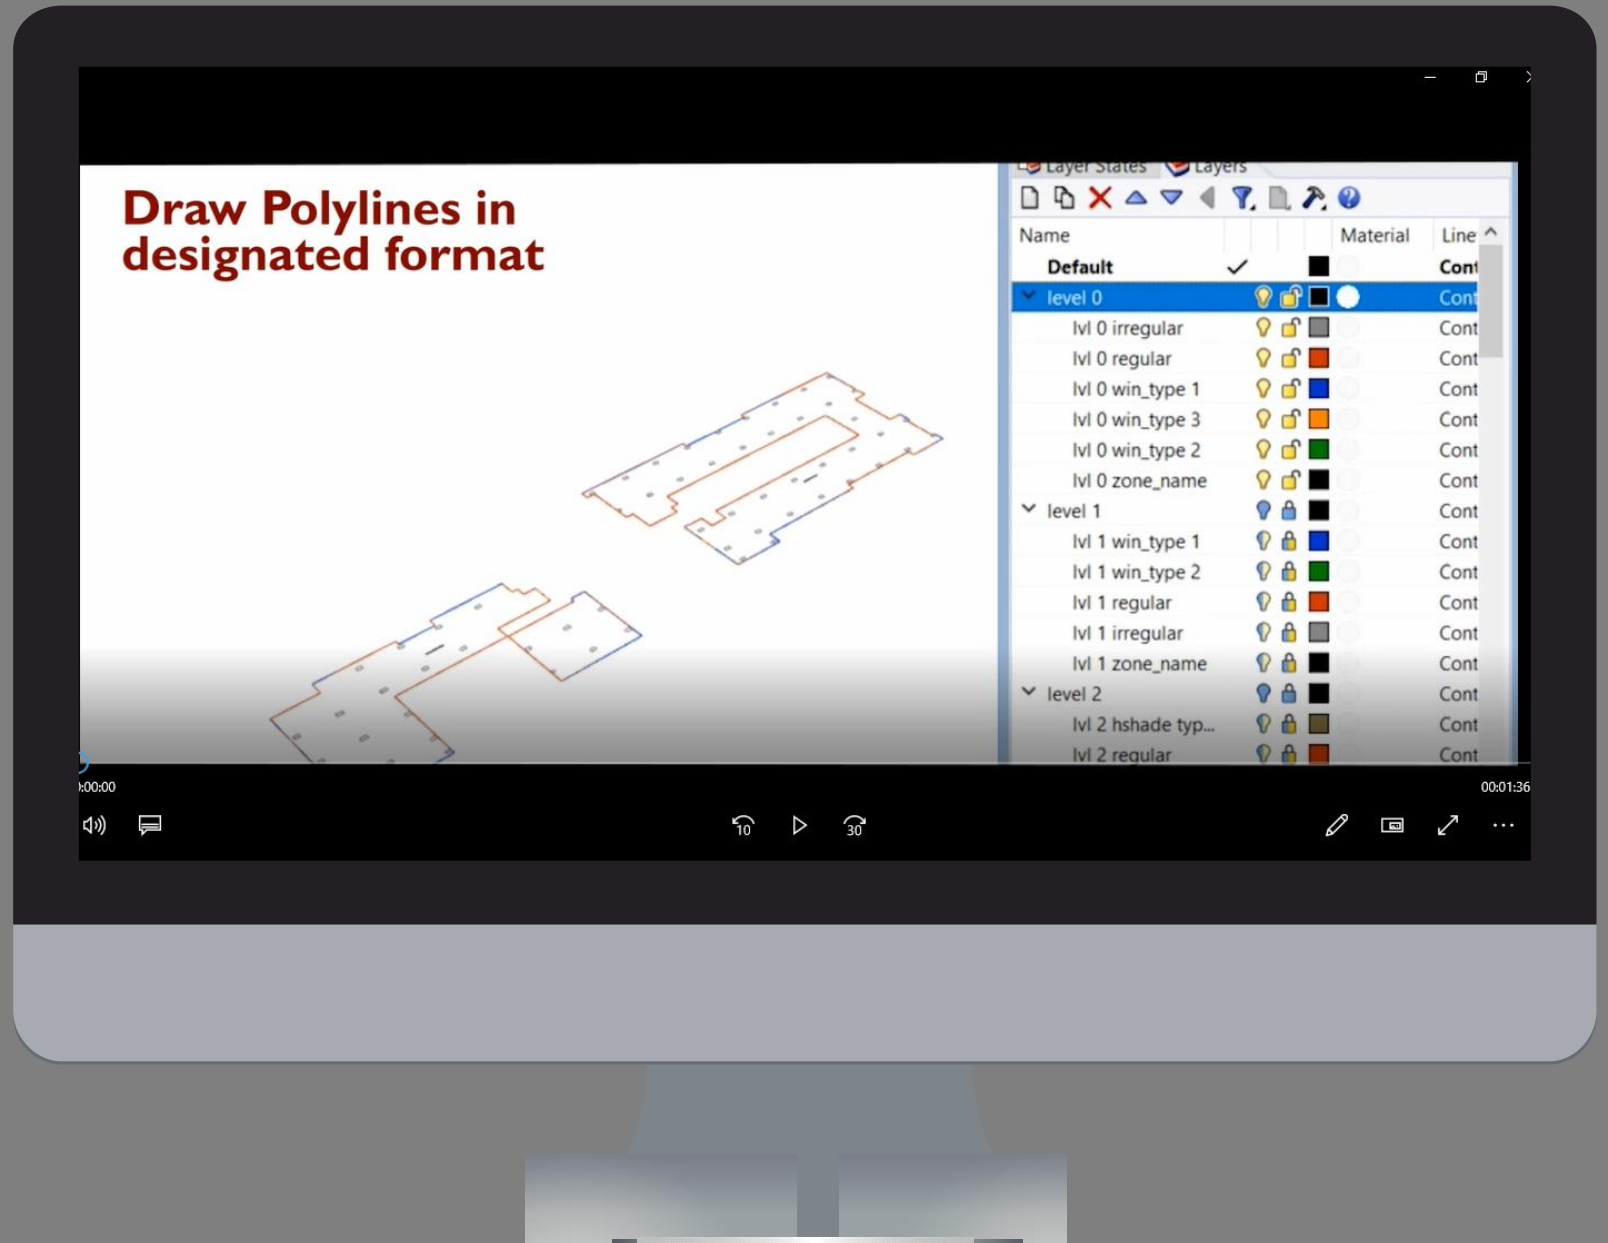

Solution

Geometry generation
is automated by
Layer data Mapping

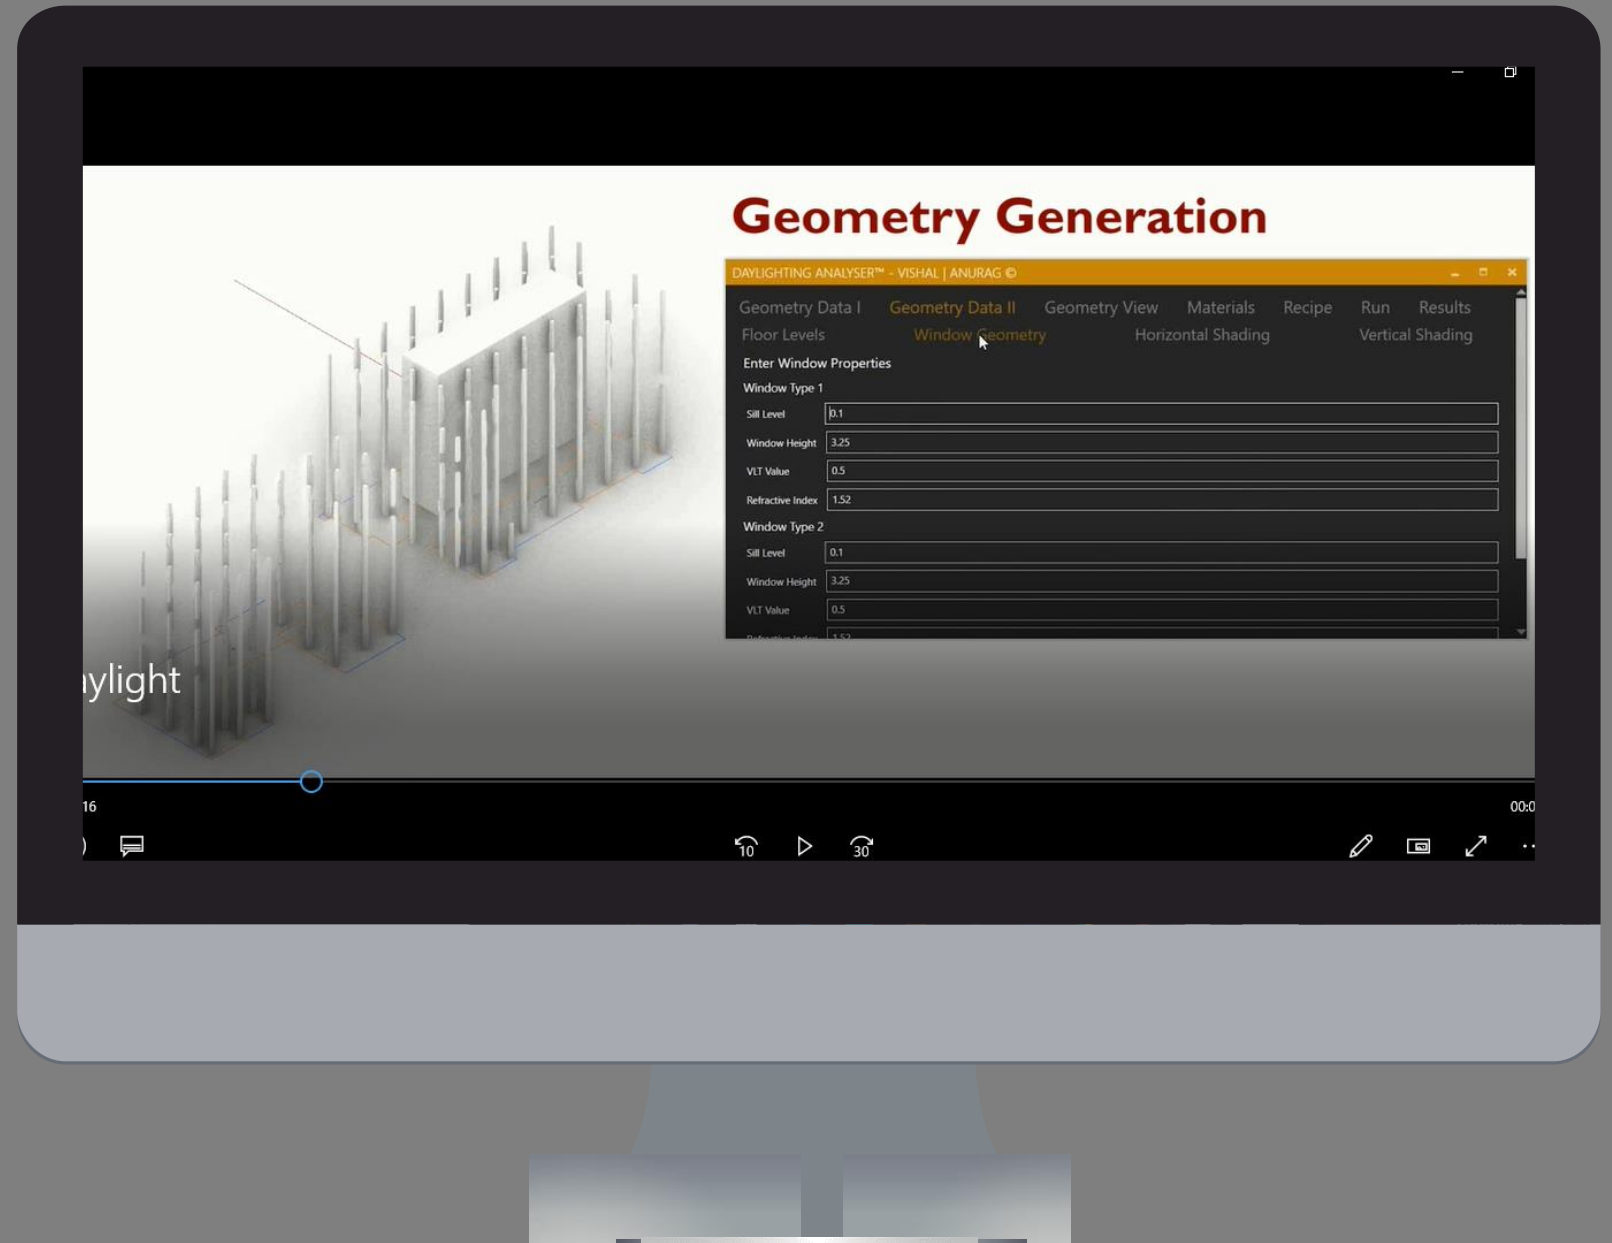

Process

1. User needs to draw polylines in designated layers

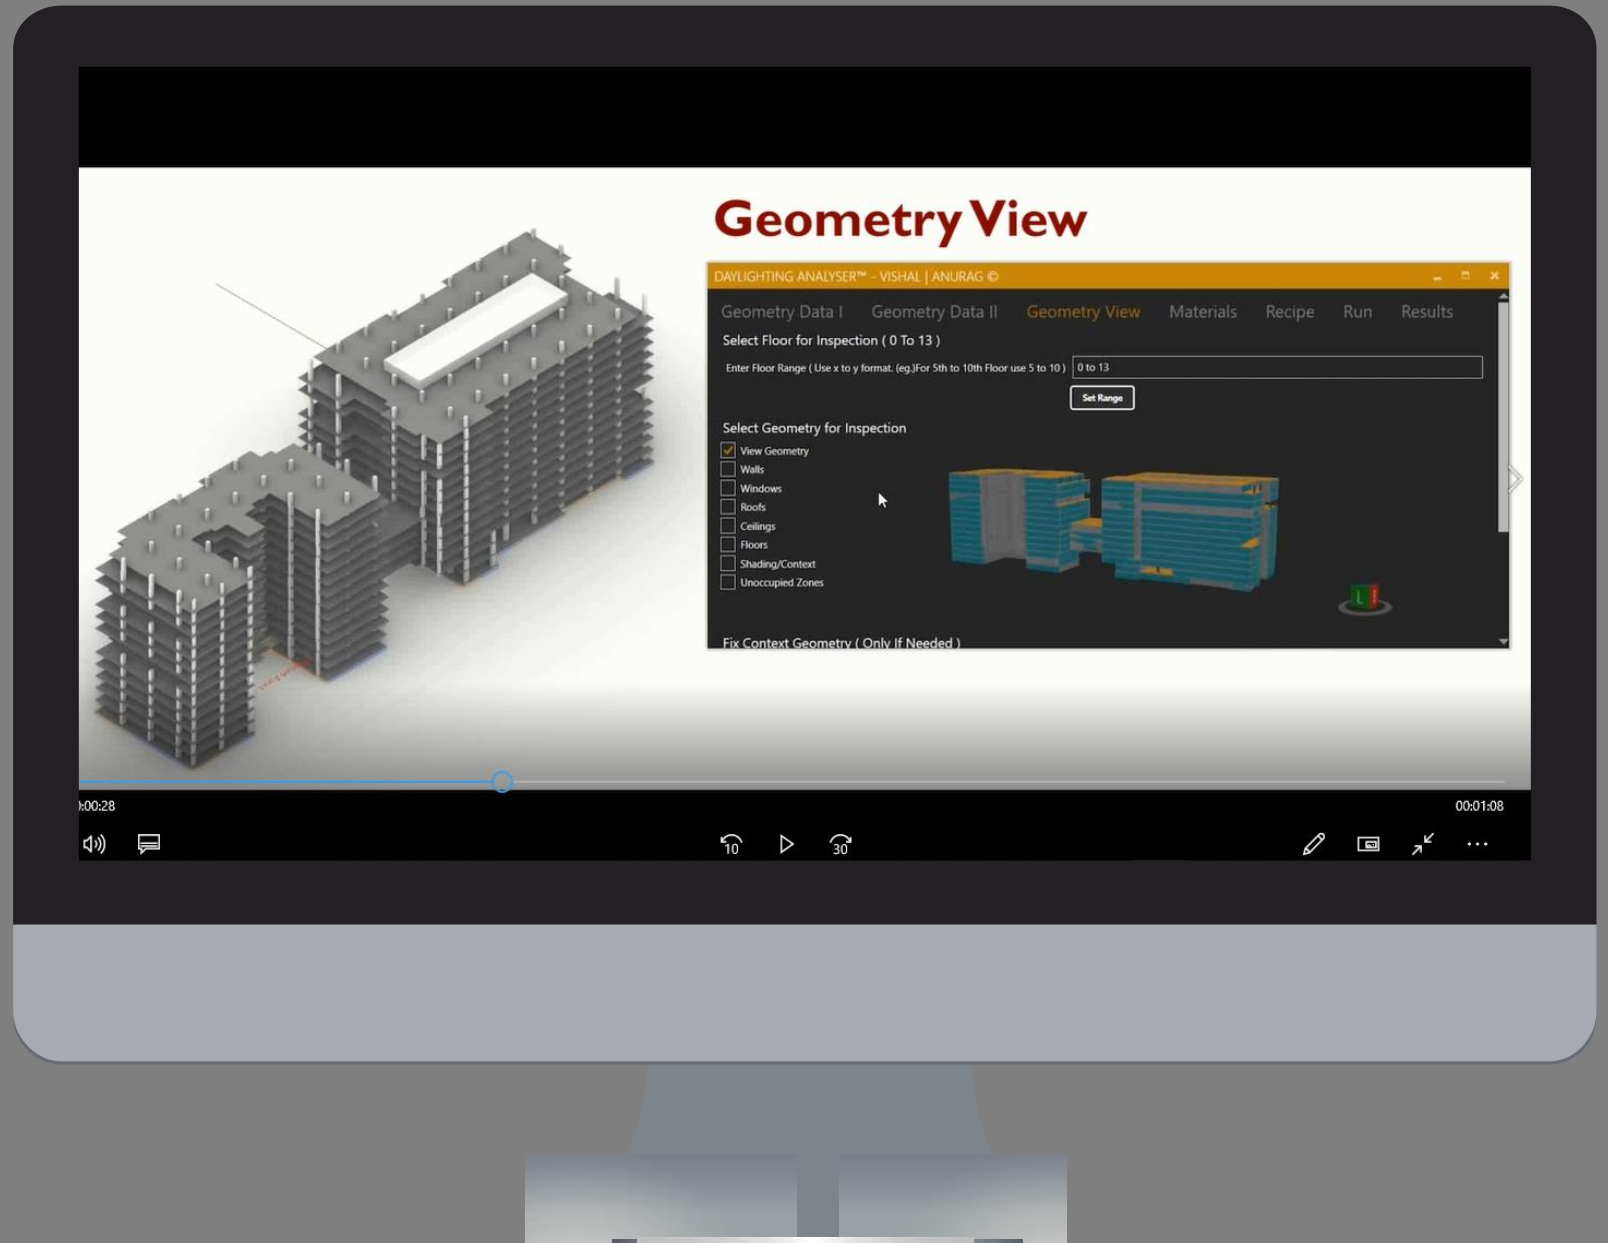

Process

2. Give dimensional inputs for Floor levels, Windows, Shading, etc

Process

3. Whole building
Geometry is
automatically
created

Pain point 2:

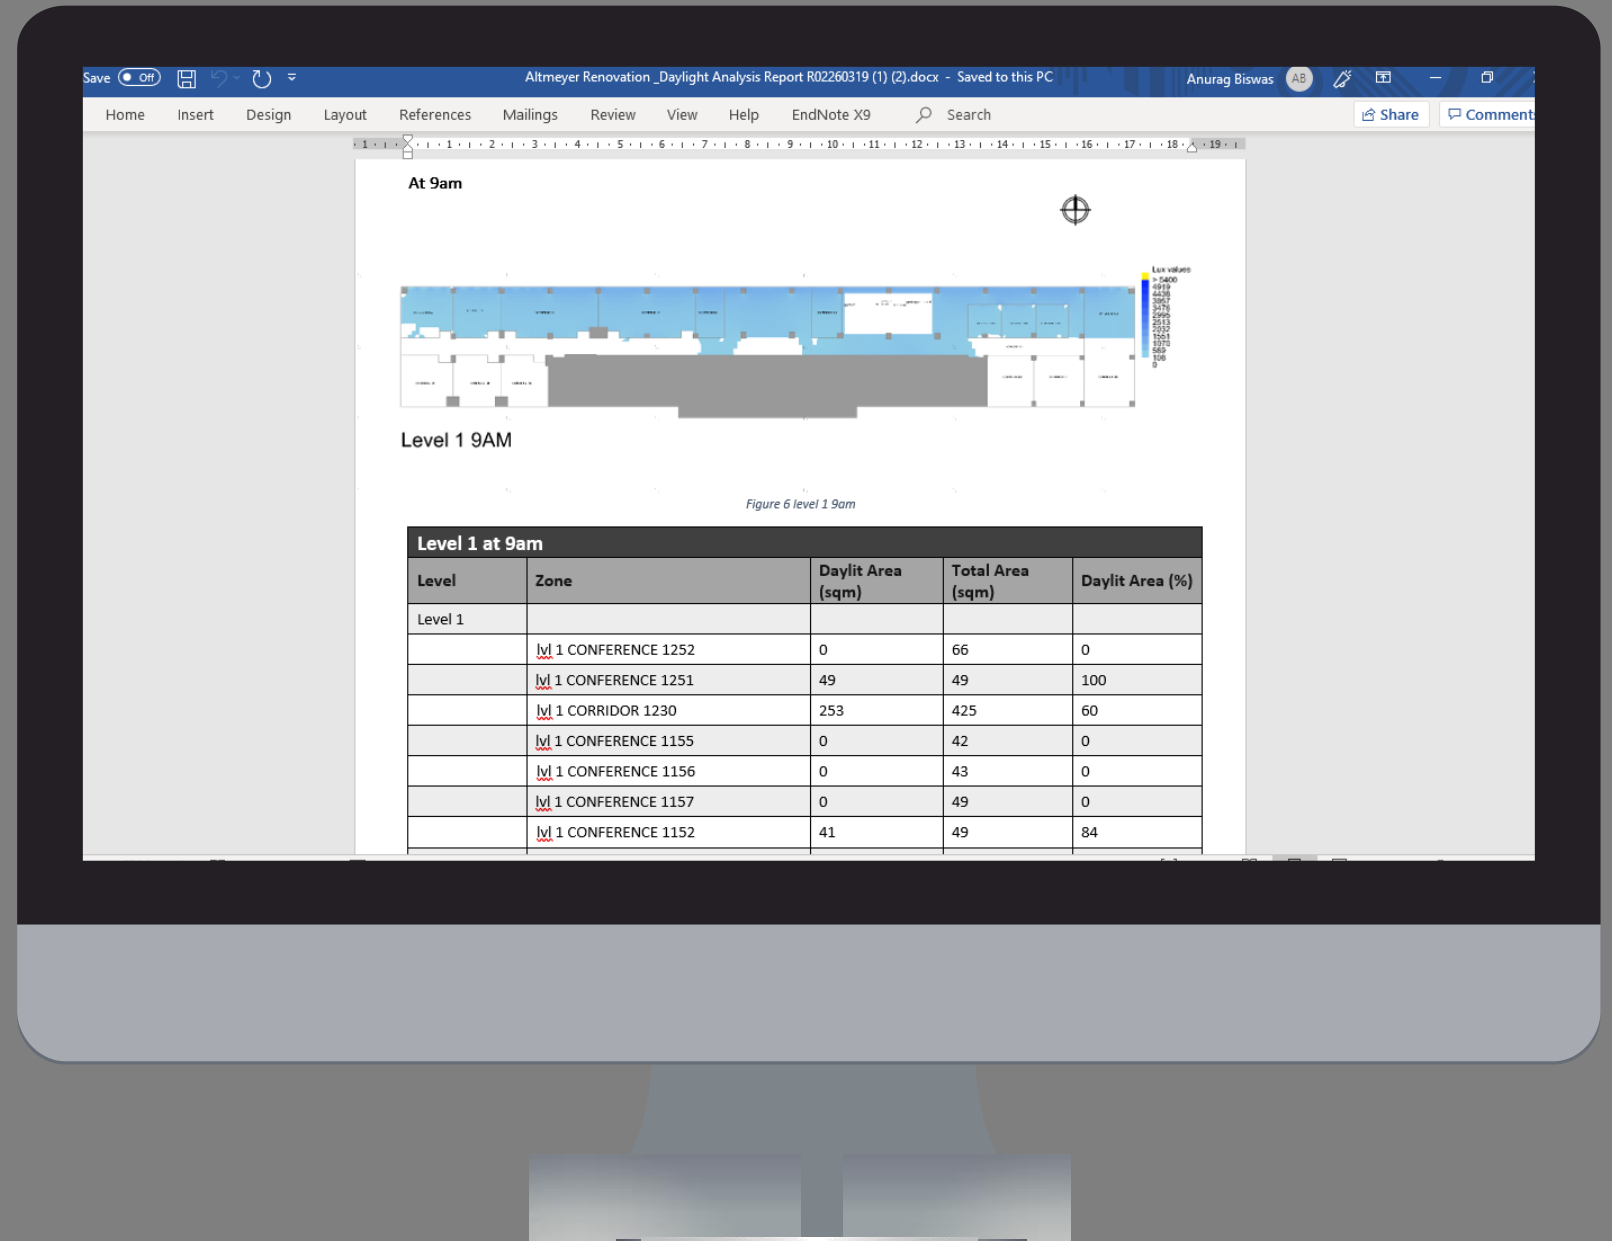

LEED compliance asks for space by space daylight reporting

However, most simulation software simulates Daylight floor by floor.

A lot of effort and time goes into post-processing the result

Solution

This tool generates formatted report, images and excel files which has Space by Space reporting

Pain point 3:

LEED Option 2 compliance Instructions dictates that we need to take clearest sky from 15 days of the Equinoxes for Daylight simulation.

To do it manually takes a lot of hard work and expert level knowledge

Solution

The inbuilt algorithm automatically creates the desired skyfile.

To find out Sky Clearness this Definition from core Radiance algorithm is used:

```
double sky_clearness()  
{  
    double value;  
  
    value = ( (diffuseirradiance + directirradiance)/(diffuseirradiance) +  
1.041*sunzenith*M_PI/180*sunzenith*M_PI/180*sunzenith*M_PI/180 ) / (1 +  
1.041*sunzenith*M_PI/180*sunzenith*M_PI/180*sunzenith*M_PI/180) ;  
  
    return(value);  
}
```

Pain point 4:

Generally, other daylight simulation tools enable us to do Floor by Floor simulation

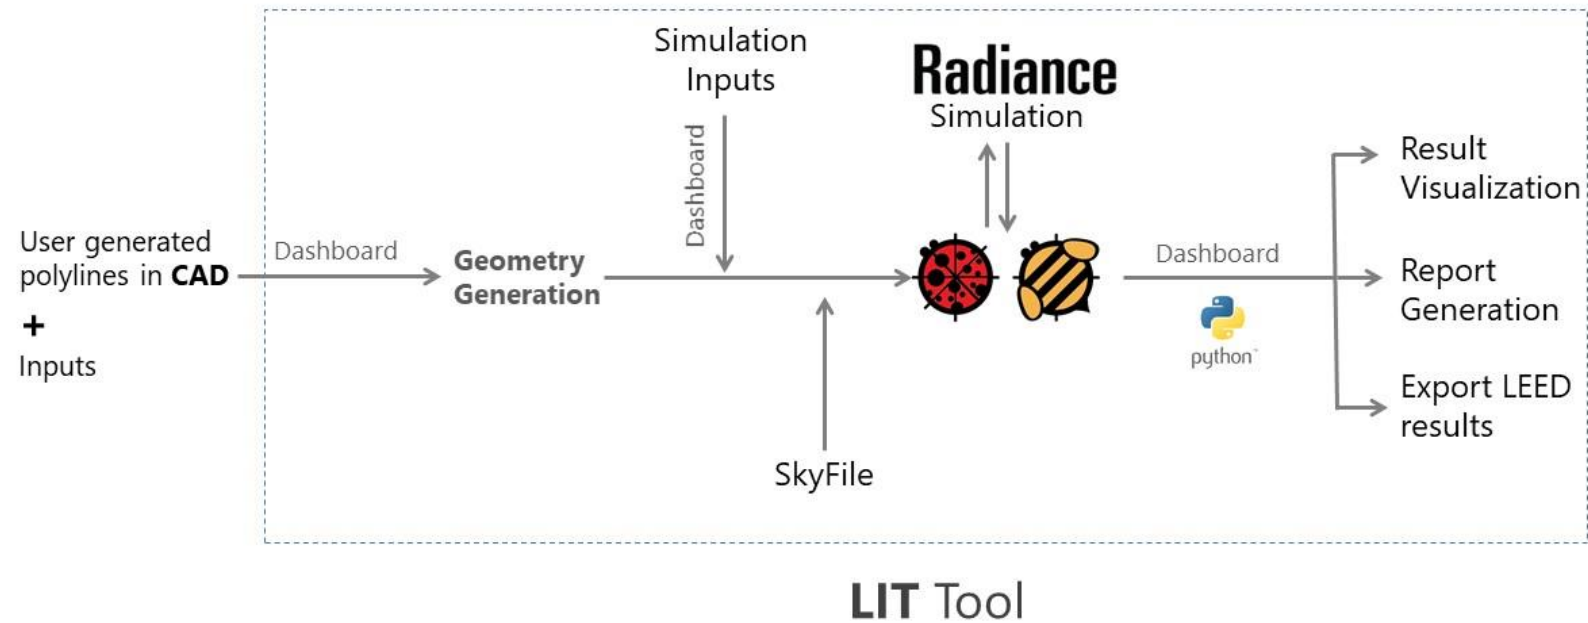

This takes simulation time for each floor.

Solution

Only one simulation is needed as the **whole building** is simulated together.

This speeds up the total process.

WorkFlow

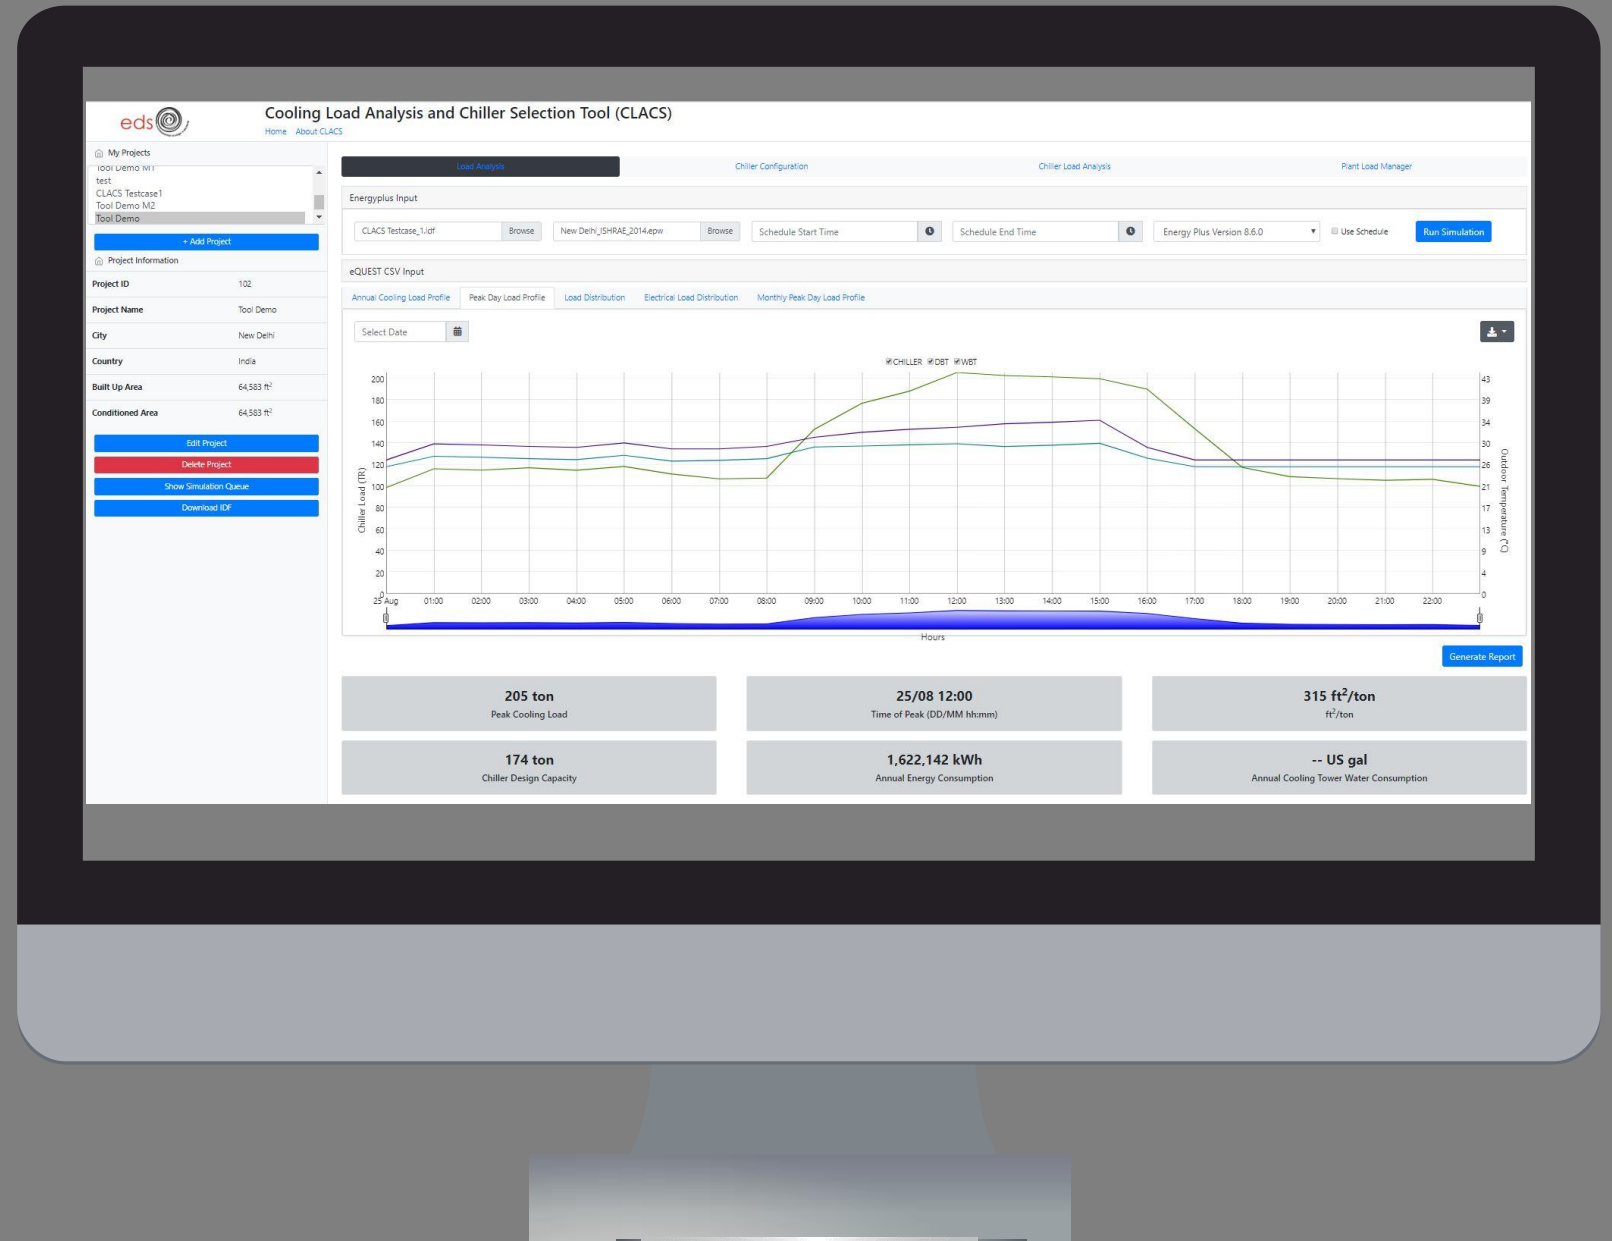

Draw Polylines in designated format

Output

- Annual Cooling Load profile
 - Peak Day Cooling Load Profile
 - Cooling Load Bin Sizing
 - Monthly Peak Day Load Profile
-
- Graphs Data can be exported in csv format
-
- Report Generation for Module 1 & Module 3
-
- Modified Energyplus input files can be download

ECBC Baseline Generator

Tool for automating
ECBC compliance via
Whole Building
Performance
Approach

Pain points

- Compliance documentation is a tedious and error prone process
- Energy Conservation Building Code (ECBC) is comprehensive and accommodates several use cases as exceptions.
- There is no platform for ECBC compliance automation in the public domain
- **ECBC COMPLIANCE IS MANDATORY, bridging this gap is essential.**

The Process

Rule-Sets

Database

Prototypes

Pseudo-code

eppy

(Energy Plus for Python)

User Workflow

User Creates a Simulation model of the Designed Case on native E+, OS or DB following some naming conventions

The user created Input Definition File (IDF) is processed in the python utility which is essentially a collection of programmed rule-sets and database interacting with E+

User created IDF

System Sizing IDF

Baseline Case IDF

Proposed Case IDF

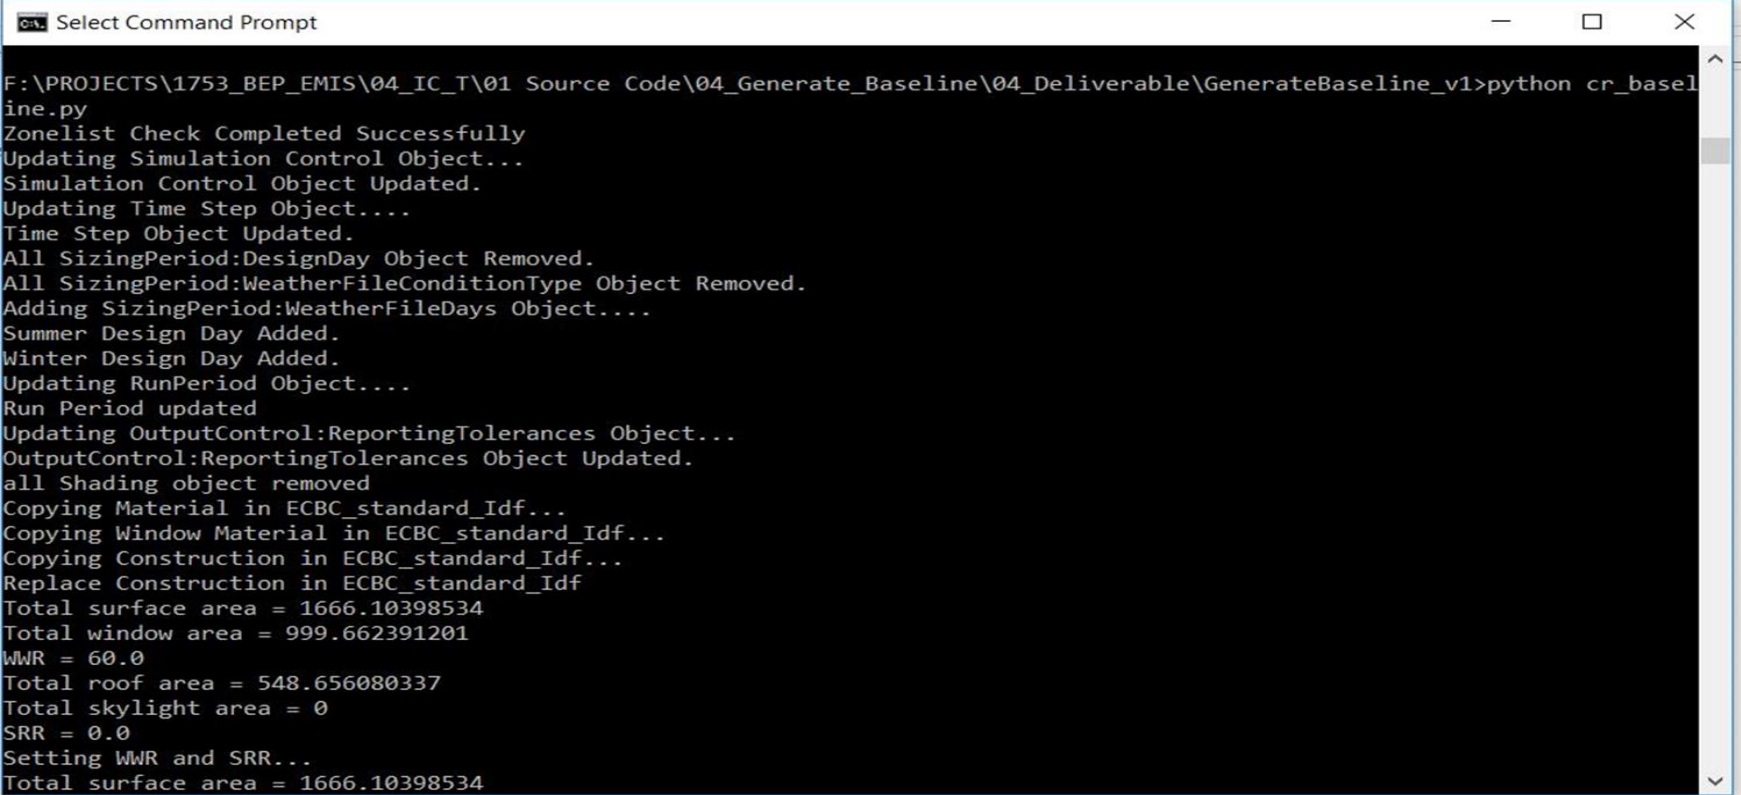

Input

- Weather File
- Compliance Level
- Location
- Proposed case IDF
- Over-sizing ratios and Temperature Set-points (Heating and Cooling)
- Special Conditions (Mandates for Air Cooled Chiller)
- Lighting Power Calculation Method

Automation

- Assignment of Mandatory and Prescriptive (as applicable) provisions for Baseline Case IDF
- Checking for Mandatory provisions in Proposed Case IDF
- Climate Zone mapping
- Baseline Envelope parameters
- Baseline HVAC System Mapping
- Baseline Lighting Systems
- etc.

Automation

```
